

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently amended) A method for manipulating at least one audio file via a graphical user interface, the method comprising the steps of:
 - displaying a timeline component having a set of time points indicative of a duration of an audio file;
 - displaying a waveform component having graphic elements that visually represent characteristics of said audio file over said duration;
 - obtaining first input to said timeline component where said first input identifies a first time point and a second time point of said set of time points, and where the first time point and the second time point are identified by a user utilizing an input device to select, within said timeline component, the first time point and the second time point, wherein said first input includes selection of the first time point and dragging from the first time point to the second time point;
 - in response to obtaining said first input, generating an initial selection overlay comprising an area of said timeline component and said waveform component, wherein said area that starts at said first time point and ends at said second time point;
 - obtaining second input, wherein the second input involves dragging said area to a region within the graphical user interface;
 - in response to obtaining said second input, performing an operation involving just the portion of the audio file that corresponds to the area, wherein the operation is performed without obtaining input to a tool selection component between obtaining said first input and obtaining said second input;
 - wherein the method for manipulating at least one audio file is performed by a computing device programmed to be a special purpose machine pursuant to instructions from program software.
 - ~~wherein generating said initial selection overlay is performed in response to obtaining said input.~~
2. (Original) The method of claim 1, wherein said characteristics of said audio file is amplitude.

3. (Original) The method of claim 1, wherein said area of said selection overlay is highlighted.
4. (Original) The method of claim 1, wherein said set of time points represents intervals of time.
5. (Currently amended) The method of claim 1 further comprising:
generating a visual representation on said timeline component and said waveform
component upon receiving said first input to said timeline component.
6. (Original) The method of claim 5, wherein said visual representation indicates a start point of
said selection overlay.
7. (Original) The method of claim 5, wherein said visual representation indicates an end point
of said selection overlay.
8. (Currently amended) The method of claim 1[[5]] wherein said operation is a copy operation
that creates a duplicate of said area within the graphical user interface, further comprising:
performing at least one special function to said area of said audio file associated with said
selection overlay.
9. (Currently amended) The method of claim 1[[8]], wherein said operation is a move operation
that moves said area from one region within said graphical user interface to another region
within the graphical user interface, at least one special function comprises a copy operation.
10. (Currently amended) The method of claim 1[[9]], wherein said operation is a cut operation
that deletes said area from the graphical user interface, copy operation comprises generating a
new instance of said area within said selection overlay.
11. (Currently amended) The method of claim 8[[10]], wherein said copy operation creates a
duplicate of said portion of the audio file that corresponds to said area, new instance comprises a
second timeline component and a second waveform component comprising a portion of said
audio data associated with said area within said selection overlay.
- 12 – 38. (Canceled)
39. (Currently amended) A computer-readable storage medium storing computer readable
program code for manipulating at least one audio file via a graphical user interface, said

computer readable program code comprising computer program code configured to cause a computer to:

- display a timeline component having a set of time points indicative of a duration of an audio file;
- display a waveform component having graphic elements that visually represent characteristics of said audio file over said duration;
- obtain first input to said timeline component wherein said first input identifies a first time point and a second time point of said set of time points, and where the first time point and the second time point are identified by a user utilizing an input device to select, within said timeline component, the first time point and the second time point, wherein said first input includes selection of the first time point and dragging from the first time point to the second time point;
- in response to obtaining said first input, generate an initial selection overlay comprising an area of said timeline component and said waveform component, wherein said area that starts at said first time point and ends at said second time point;
- obtain second input, wherein the second input involves dragging said area to a region within the graphical user interface;
- in response to obtaining said second input, perform an operation involving just the portion of the audio file that corresponds to the area, wherein the operation is performed without obtaining input to a tool selection component between obtaining said first input and obtaining said second input,
- ~~wherein said initial selection overlay is generated in response to obtaining said input.~~

40. (Previously Presented) The computer-readable storage medium of claim 39, wherein said computer program code configured to cause said computer to display said waveform component further comprises computer program code configured to cause said computer to display a data amplitude of said at least one audio file.

41. (Previously Presented) The computer-readable storage medium of claim 39, wherein said computer program code configured to cause said computer to generate said selection overlay further comprises computer program code configured to cause said computer to highlight said selection overlay.

42. (Previously Presented) The computer-readable storage medium of claim 39, wherein said computer program code configured to cause said computer to obtain input to said timeline component further comprises computer program code configured to cause said computer to represent intervals of time.

43. (Currently amended) The computer-readable storage medium of claim 39 further comprising computer program code configured to cause said computer to generate a visual representation of said timeline component and said waveform component upon receiving said first input to said timeline component.

44. (Previously Presented) The computer-readable storage medium of claim 43, wherein said computer program code configured to cause said computer to display said waveform component further comprises computer program code configured to cause said computer to indicate a start point of said selection overlay.

45. (Previously Presented) The computer-readable storage medium of claim 43, wherein said computer program code configured to cause said computer to display said waveform further comprises computer program code configured to cause said computer to indicate an end point of said selection overlay.

46. (Currently amended) The computer-readable storage medium of claim 39, wherein said operation is a copy operation that creates a duplicate of said area within the graphical user interface, further comprising computer program code configured to cause said computer to perform at least one special function with respect to said area of said audio file associated with said selection overlay.

47. (Currently amended) The computer-readable storage medium of claim 39[[46]], wherein said operation is a move operation that moves said area from one region within said graphical user interface to another region within the graphical user interface, at least one special function comprises copying data associated with said selection overlay.

48. (Currently amended) The computer-readable storage medium of claim 39[[47]], wherein said operation is a cut operation that deletes said area from the graphical user interface, computer program code configured to cause said computer to perform said at least one special function

~~further comprises computer program code configured to cause said computer to generate a new instance of said area within said selection overlay.~~

49. (Currently amended) The computer-readable storage medium of claim 39[[48]], wherein said copy operation creates a duplicate of said portion of the audio file that corresponds to said area, new instance further comprises a second timeline component and a second waveform component comprising a portion of said audio data associated with said area within said selection overlay.

50 – 52. (Canceled)
